

Course Title: SkyPilot Technical Training
Cost: \$ 1,000
Duration: 3 days
Location: Santa Clara, California

2007 Corporate Class Schedule	
Q3 2007	August 21 - 23
Q4 2007	November 13 - 15

Course Overview:

“SkyPilot Technical Training” is a comprehensive, instructor-led course designed to prepare students to install, configure and operate SkyPilot equipment. The course focuses on preparing students with the essential knowledge to install, maintain and operate their SkyPilot system using SkyPilot’s hardware and software products. The subjects covered include site survey requirements, the SkyPilot wireless operational theory, planning the deployment, installation, maintenance, and troubleshooting.

Hands-on experience using both the CLI and SkyPilot EMS is gained through lectures and exercises covering all aspects of the SkyPilot family of products.

Target Audience:

Technical staff tasked with the design and deployment; installation and configuration/provisioning; troubleshooting and support of SkyPilot equipment.

Prerequisites:

To benefit the most from this course, attendees should already have a general understanding of, and experience with, networking concepts such as:

- OSI Layer 2: wired and wireless LAN technologies (Ethernet, 802.11b)
- OSI Layer 3: TCP/IP networks, DHCP, SNMP, and routing protocols
- RF Basics in the wireless spectrum

Objectives:

Upon completion of this course, the students will understand the features, operation, and technology behind a SkyPilot network and be able to perform the following responsibilities:

- Determine optimal locations for nodes based on the target customers and environmental factors
- Install SkyPilot software and hardware equipment in different environments
- Configure nodes through either the CLI or EMS
- Operate and maintain the wireless network
- Troubleshoot and isolate issues for both hardware and software products
